                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 77, Application US/09921397

Sequence 77, Application US/09921397

Patent No. US20020151484A1

GENERAL INFORMATION:
APPLICANT: HYBRIGENICS

TITLE OF INVEWTION: Dathogenic strain of the hepatitis C virus and
TITLE OF INVEWTION: applications thereof
FILE REFRENCE: B409A - JAZ

CURRENT APPLICATION NUMBER: US/09/921,397

CURRENT FILING DATE: 2001-08-02

PRIOR FILING DATE: 2000-08-03

NUMBER OF SEQ ID NOS: 156

SOFWARE: PATENTIN Ver. 2.1

SEQ ID NO 77

TYPE: PRT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 97;

artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus. Sequences AAY06673-683 represent amino acid sequence of each monomer comprising the NC mosaic protein.

                                       The invention relates to a mosaic protein, comprising a plurality of homologous antigenic peptides from different genotypes of a species. The artigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosaic protein is also provided. The method is designated restriction endonuclease assisted ligation (REAL). The mosaic protein and the artificial mosaic protein are useful for detecting a hepatitis infection in an individual. The mosaic gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosaic protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   homologous antigenic peptides from different genotypes of a species. It codes for AAKS8593 an antigen to a structural region of the HCV virus, which can be used in the diagnosis of NANBH patients and the detection of HCV carriers.
                                                                                                                                                                                                                                                                                                                                                                                                                          Non-A non-B hepatitis virus antigens; NANBH; hepatitis C virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Misc-difference
ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  homologous antigenic peptides from different genotypes of a species. The antigenic peptides are from nucleocapsid (NC) proteins. A method for synthesising an artificial gene that encodes the mosalc protein is also provided. The method is designated restriction endonuclease assisted rigation (REAL). The mosalc protein and the artificial mosalc protein are useful for detecting a hepatitis infection in an individual. The mosalc gene and protein is also useful for vaccination against infection, especially hepatitis C. The method of synthesizing the artificial gene and the resulting mosalc protein improve the sensitivity, spectrum of immunoreactivity, and antigen specificity of enzyme immunoassays. This provides improved detection of hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Polymerase chain reaction; PCR; amplify; primer; non-A, non-B hepatitis; NANBH; virus; blood transmissible; detection; hepatitis virus; RT-PCR; C100 antibody; HCV RNA; NS5 region.

The invention relates to nucleic acid construct which comprises an expression cassette including a first polynuclectide region including a 5 non-cooling region (NR) sequence of an RR, virus and at least an N-terminal portion of a coding sequence of RNA virus, a second colynuclectide region including a 3' untranslated region (UTR) sequence of polynuclectide region (UTR) sequence of the RNA virus and at least a C-terminal portion of a coding sequence of the virus and a third polynuclectide region (UTR) sequence of the virus and a third polynuclectide region conditions; and a promoter sequence being operatively linked to expression cassette in a manner so as to enable a transcription of a minus strand RNA molecule from the expression cassette. Nucleic acid construct of the invention is useful for detecting the presence of an RNA virus in a cell. It is also useful for screening anti-viral drugs and determining drug resistance of an RNA virus. The present sequence is Hepatitis C virus (HCV) isolate HCV-SI full-length polyprotein.
 Novel nucleic acid construct useful for detecting the presence of RNA virus, comprises an expression cassette and a promoter operably linked to expression cassette for minus strand RNA transcription of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is encoded by the oligonucleotide, CN14, and represents the peptide fragment CP14. CP14 is a fragment of the core region of hepatitis C virus (HCV). CP14 may be used in the detection of HCV infection and to raise antibodies against it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detection of hepatitis C virus - using oligopeptide fragment of core region

                                                                                                                                                                                                                                                                                                                                                                                 This sequence is encoded by the genome of a blood transmissible non-A, non-B hepatitis (NANBH) virus. The CDNA sequence was isolated using the primers given in AAQ63500-35. The amplified fragments are used in the detection of hepatitis virus. The target DNA was isolated from serum of chronically infected NANBH patients who were Cl00 antibody-positive and HCV RNA (NS5 region) positive. Reverse transcription-PCR and PCR were performed on CDNA and the total human NANBH DNA was constructed from 23 clones.

```
The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 3M and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope artibodies in the diagnosis of non-A, non-B hepatitis (NANDH), and in competitive inhibition assay for detecting HCV specific
                                                                                                                             Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-A, non-B hepatitis; competitive; inhibition assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hepatitis C virus; HCV; open reading frame; "common" sequence; capsid protein; epitope; immunoassay; antibody; diagnosis; NANBH; non-8 hepatitis; competitive; inhibition assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic peptide epitope with sequence encoded by hepatitis-C virus - for immunoassay for antigens for diagnosis of non-A, non-B hepatitis

They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contain epitope artibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific

The present sequence represents a Hepatitis C virus (HCV) protein sequence from the disclosure of the present specification. The present specification describes a chimeric HCV peptide antigen which comprises at least 2 peptide epitope regions from the HCV polypeptide core region, 2 peptide epitope regions from the NS3 region and at least 2 peptide epitope regions from the NS4 region. The antigen binds specifically with an antibody produced by a human infected by HCV. The peptide can detect a wide range of HCV infections with high sensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New chimeric peptide antigen derived from hepatitis C virus protein - useful for detecting HCV infections
                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis C virus; HCV; chimeric; antigen; detection; core region; epitope; NS3; NS4; infection.
                                                                                                                                                                                                      ö
                                                                                     Hepatitis C virus #4 and #6 genes were isolated (AAQ64068-69). Both genes contain the core, ENV, NS1, NS2 and NS3 regions. A core region fragment is given in AAQ64067.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

                                                                                                                                                                                                                                                                                                 The sequences given in AAR30665-89 represent fragments of the Hepatitis C virus (HCV) amino acid sequence. They represent the beginning of the HCV open reading frame to amino acid 38 and encompass the "common" sequence. These peptides are contained in the capsid protein of the virus and themselves contained in the capsid protein of the virus and themselves contained in arrows. These peptides can be used in immunoassays for HCV antibodies in the diagnosis of non-A, non-B hepatitis (NANBH), and in competitive inhibition assay for detecting HCV specific

Monoclonal antibodies useful for detecting and/or quantifying hepatitis \mathsf{C} virus core protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polypeptides that bind to anti-hepatitis C virus antibodies, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptides AAY26949-Y26955 represent peptide epitopes derived from the N-terminus of the hepatitis C virus core protein. The peptides are used to generate monoclonal antibodies or antibody fragments specific for hepatitis C virus (HCV) core protein. The monoclonal antibodies are used for early diagnosis of HCV infections, especially by two-antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; hepatitis C virus; HCV; immunogen; antigen; antibody; virucide; hepatotropic; anti-inflammatory; virus detection; vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human hepatitis C virus core protein N-terminus, residues 2-45,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              complex formation). Antibodies are used correspondingly to detect HCV or related antigens. The peptide and antibodies may also be used to treat or prevent HCV infections. The present sequence represents the N-terminus of the core p21 protein of hepatitis C wirus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a peptide, which is recognised by antibodies against amino acids 2.45 at the N-terminus of the core (or nucleocapsid) p21 protein of hepatitis c virus (HCV), or its variants. The peptide has a tertiary structure consisting of two alpha-helical fragments, almost perpendicular to each other in space, connected by a junction peptide. Excluded are all proteins and peptides comprising, or consisting of, the N-terminal part of p21 (starting from amino acid 1 or 2). Also new are (1) monoclonal or polyclonal antibodies produced using the peptide as an immunogen and (2) complex consisting of the peptide specifically bound to some other molecule, particularly peptide or nucleotide fragments or functionalised aromatic compounds. The peptide is used (i) quantifying either antibodies against p21 or HCV-deriyed mRNA (by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nseq

diagnosing and preventing hepatitis C infections -

Claim 1; Page 42; 50pp; English.

The present peptide, designated 542G, corresponds to residues 2 to 45 of the N-terminus of the human hepatitis C virus (HCV) core protein. It is an immunodominant region containing conformational type epitopes and linear type epitopes. It manifests an immunoreactivity with all the sera of individuals or blood samples infected with HCV and which possess antibodies directed against the core protein. An amino acid may be substituted for homologous amino acids and side chains and peptide bonds may be modified. For example, L-amino acids may be replaced by D-amino acids, amine groups may be acetylated, and so on. The native antigenic sequence and its antigenic derivatives may be used for detection of hepatitis C virus and for raising antibodies against the virus.

submitted to the EMBL Data Library, January 1994
A; Description: Analysis of hepatitis C virus genotypes 1 to 5 by LiPa.
A; Reference number: S41341
A; Accession: S41355
A; Molecule type: genomic RNA
A; Residues: 1-108 < VANN
A; Cross-references: EMBL: 229458
A; Experimental source: genotype 2, N4
C; Superfamily: hepatitis C virus genome polyprotein
C; Keywords: capsid protein; core protein; polyprotein
F; 1-108/Product: core protein #status predicted <MAT>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              genome polyprotein - hepatitis C virus (genotype 2, N6) (fragment)
N;Contains: core protein
C;Species: hepatitis C virus
C;Species: hepatitis C virus

-!- FUNCTION: THE SAMAL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
-!- FUNCTION: THE SAMAL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
-!- FUNCTION: THE SAMAL PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY LIPOPROTEIN MAND GLYCOPROTEIN E. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN A AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CELLULAR AMINOPEPTIDASE.

"Genomic characterization and mutation rate of hepatitis C virus
isolated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.;

Gen. Virol. 73:2725-2729(1992).

-I- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROFIEN BNELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

-1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.

THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA. PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTECTIVIT OF PROCESSING BY THE HOST SIGNAL PEPTIDASES. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

Mucleotide sequence of the genomic RNA of hepatitis C virus isolated from a human carrier: comparison with reported isolates for conserved of divergent regions.";
J Gen. Virol. 72:2697-2704(1991).
C -I- FUNCTION: THE SMALL PROPEINS NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
C -I- CATALYITC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in pl and Ser or Ala in Pl'
C -I- CATALYITC ACTIVITY: N nucleoside triphosphate - N diphosphate +

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2 (GP69) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
VITUSES; SERNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (RNA)(N).
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29

C-1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
C-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.
C-1- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-AUG-1992 (Rel. 23, Created)

6enome polyprotein (Contains: Capsid protein C (Core protein) (P22);
6enome polyprotein El (GP32) (GP35); Envelope glycoprotein E2
6press (GP68) (GR10) (NS1); Protein P1 Nonstructural protein NS4 (P4); Nonstructural protein NS4 (P4); Nonstructural protein NS4 (P4); Nonstructural protein NS5 (P56); Nonstructural protein NS5 (P56); Nonstructural protein NS5 (P66) (P77); Nonstructural protein NS5 (P66); NS5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (RNA)(N).

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                   (POTENTIAL).

COFACTOR: CALCION-DEPENDENT.
ENZYME REGULATION: COULD BE INHIBITED BY THE NOT SECONDLY CLEAVED

respective precursors.

PROPEPTIDE

-

++ -

,99999999999

-!- SUBCELLULAR LOCATION: SEEMS TO BE LOCALIZED INTRACELLULARLY TO THE TRANS GOLGI NETWORK. PROPEPTIDE CLEAVAGE IS A PREREQUISITE FOR EXIT OF FURIN MOLECULES OUT OF THE ENDOPLASMIC RETICULM (ER). SECOND CLEAVAGE IN THE PROPEPTIDE OCCUR IN THE TRANS GOLGI NETWORK (TGN), WHICH IS FOLLOWED BY THE RELEASE OF THE PROPEPTIDE BOUND TO FURIN AND THE ACTIVATION OF FURIN.

-!- TISSUE SPECIFICITY: SEEMS TO BE EXPRESSED UBIQUITOUSLY.

-!- DOMAIN: CONTAINS A CYTOPLASMIC DOMAIN RESPONSIBLE FOR ITS TGN LOCALIZATION AND RECYCLING FROM THE CELL SURFACE.

-!- PTW: THE PROPEPTIDE IS AUTOCATALYTICALLY REMOVED THROUGH AN INTRAMOLECULAR CLEAVAGE PROBABLY IN THE ENDOPLASMIC RETICULUM (ER). IN THE TGN THE SECOND CLEAVAGE IN THE PROPEPTIDE COULD LEAD -!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8. FURIN SUBFAMILY -!- SIMILARITY: Contains 1 homo B/P domain.

SUBUNIT: THE VURLON OF THIS VIRUS IS A NUCLECCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

Identification and characterisation of Thai isolates of hepatitis C
       Submitted (MAR-1995) to the EMBL/GenBank/DDBJ databases.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GIVCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

"Genetic variability of hepatitis C virus in Western Siberia.";
Submitted (APR-2002) to the EMBL/GenBank/DDBJ databbases.
-1- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).

"Genetic variability of hepatitis C virus in Western Siberia.";
"Genetic variability of hepatitis C virus in Western Siberia.";
Submitteed (Apr-2002) to the EMBL/GenBank/DDBs databases.
-1-SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).
